

Polar Bears

By: Xina and Rita

Polar bears spend over 50% of their time hunting for food. And because of the high temperature, the ice is starting to melt so the polar bears' habitat is getting destroyed.

Is the polar bear population in crisis?

Scientists argue that the melting of the sea ice is leading to the depletion of polar bear population.

Why are polar bears on the Endangered Species List?

Because of the loss of their sea ice habitat resulting from climate change.

Why is the climate changing?

The climate is changing because of the influence of humans on climate change. We drive cars, heat houses when it is cold outside and use energy to cook. These activities cause the emission of greenhouse gases, such as methane and carbon. These gases prevent the heat from escaping the Earth, causing global warming.

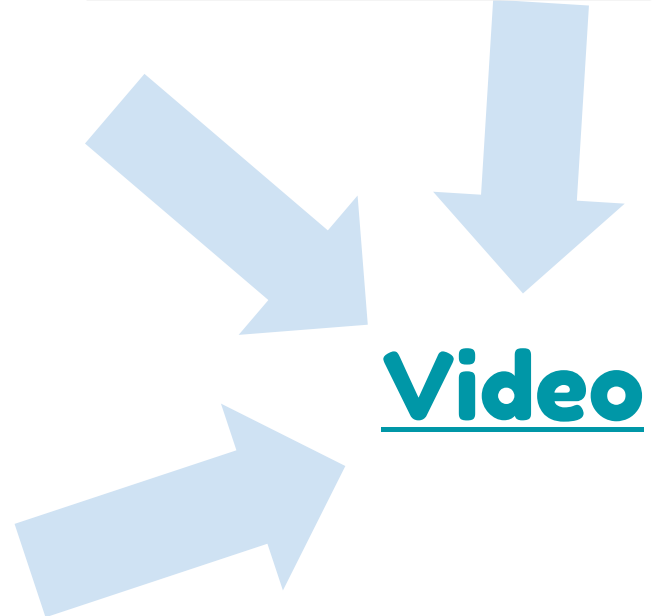

Why Are Polar Bears Endangered?

Global warming!

-Global climate is changing faster than we anticipated, and it's one of the biggest reasons why some animals are losing their natural habitats.

-People are divided by this problem. Some believe that we should act as soon as possible, others say global warming is a lie.

-One thing is certain. Climate is changing, and it's affecting more and more animals. Polar bears are one of the most affected animals by global warming.

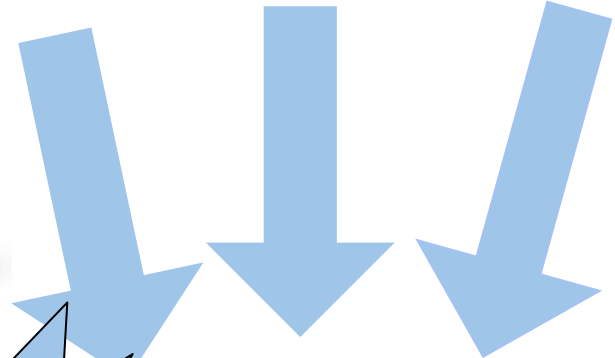

What can people do to help polar bears?

Turn down your thermostat a little bit in the winter, walk places instead of driving, take public transportation as much as possible.
